EDUCATION

KLS Vishwanathrao Deshpande Institute of Technology — Jul. 2020 – Nov. 2023
B.E. in Computer Science — Hubli, Karnataka

Sharpener Tech — Dec. 2023 – Mar. 2024
Training Program in Full Stack Development — Online

EXPERIENCE

Software Engineer — Jun. 2024 – Sep. 2026
Helo.ai — Mumbai

- Built a centralized UI library using **React.js, TypeScript, and Storybook**, cutting duplicate component code by an estimated **~30%**.
- Managed **~4-5 modules in a micro-frontend architecture**, enabling parallel team development and unblocking independent deployments.
- Migrated legacy **Angular applications to Next.js**, boosting page load performance by **~30-40%** via SSR and optimized bundling.
- Standardized responsive layouts using **Tailwind CSS**, accelerating UI implementation across all frontend micro-services.
- Architected complex UI state and multi-step forms using **Redux, React Hook Form, and Zod**, eliminating client-side validation bugs.
- Enforced strict **TypeScript** typing across the frontend, catching compile-time errors and reducing UI bug reports by **~20%**.
- Designed scalable **RESTful APIs with Node.js and Express.js**, standardizing authentication, payload validation, and error handling.
- Integrated **Redis caching** for high-traffic endpoints, slashing average API latency by **~40-50%** and reducing main database load.
- Implemented **RabbitMQ** for asynchronous inter-service communication, replacing synchronous HTTP calls to decouple backend microservices and ensure reliable message delivery.
- Deployed **Node.js clustering and worker threads** for CPU-intensive processing, parallelizing tasks and boosting throughput by **~3x**.
- Configured automated **CI/CD pipelines** for continuous integration, streamlining deployments across all frontend and backend services.

PROJECTS

TicketFlow — Microservices Event Booking System | GitHub

- Architected a **microservices-based event booking system** with 6 independent services: user management, event listing, seat reservation, payments, notifications, and an API gateway.
- Implemented **Redis distributed locking** to prevent race conditions during concurrent seat bookings, ensuring data consistency under high load.
- Designed **asynchronous event-driven communication** using RabbitMQ, decoupling workflows like booking confirmation and notification dispatch.
- Optimized query performance using **MongoDB compound indexing and Redis caching**, reducing read latency on high-traffic endpoints by an estimated **~50-60%**.

Dev Tinder — Developer Networking Platform | GitHub

- Built **REST APIs in Node.js and Express** for profile browsing, connection requests, and feed; designed scalable **MongoDB schemas** with compound indexing for efficient queries.
- Implemented **JWT auth with bcrypt** password hashing, cookie-based sessions, and protected routes; managed UI state with **Redux Toolkit** across feed and connection flows.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, HTML5, CSS3
Frameworks & Libraries: React, Next.js, Redux, Node.js, Express, Tailwind CSS, React Hook Form, Zod, Axios
Databases: MongoDB, SQL, Redis
Cloud & Infrastructure: Docker, Docker Compose, Jenkins CI/CD, RabbitMQ
Tools & Platforms: Git, Cursor, Antigravity
APIs & Authentication: REST APIs, JWT Authentication
Learning (AI/ML): Python, FastAPI, RAG, Vector DB
